

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Exploring Mental Health Awareness and Support in the Tech Industry

The domain of the Project:

SQL AND POWERBI

Team Mentors (and their designation):

Mr Sarvana Nemana

Team Members:

Mr. Bapi Saha

Period of the project

June 2025 to December 2025

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Declaration

The project titled “Exploring Mental Health Awareness and Support in the Tech Industry” has been mentored by **sarvana Nemana**, organised by SURE Trust, from June 2025 to December 2025, for the benefit of the educated unemployed rural youth for gaining hands-on experience in working on industry relevant projects that would take them closer to the prospective employer. I declare that to the best of my knowledge the members of the team mentioned below, have worked on it successfully and enhanced their practical knowledge in the domain.

Team Members: Mr. Bapi Saha

Mentor’s Name : **Sarvana Nemana**

Designation— Director Bounteous India, Chennai

Prof. Radhakumari

Executive Director & Founder

SURE Trust

Innovation & Entrepreneurship Hub for Educated Rural Youth (SURE Trust – IERY)

Executive Summary

Mental health has emerged as a critical concern in the modern workplace, particularly within the technology industry, which is known for its fast-paced environment, high performance expectations, and extended working hours. This project focuses on exploring mental health awareness, employee perceptions, and the level of organizational support available in the tech sector. The study aims to understand how workplace culture, company policies, and social attitudes influence employee well-being and mental health outcomes.

Using survey-based data collected from employees across multiple countries, the project analyzes key indicators such as employer-provided mental health benefits, comfort in discussing mental health issues at work, professional help-seeking behavior, and overall workplace attitudes toward mental health. These indicators help identify existing gaps between employee needs and organizational support systems.

The findings highlight that while awareness around mental health has improved, significant challenges remain in terms of stigma, uneven access to mental health resources, and inconsistent employer support across regions. The project emphasizes the importance of proactive mental health policies, open communication, and culturally sensitive support systems. Overall, this study provides valuable insights for organizations, policymakers, and industry leaders to create healthier, more inclusive, and supportive work environments.

Introduction

Mental health is an essential component of overall well-being, influencing an individual's productivity, creativity, and quality of life. In the technology industry, employees often face unique stressors such as tight deadlines, rapid technological changes, job insecurity, remote work challenges, and long working hours. These factors make mental health awareness and support especially important in this sector.

Despite growing discussions around mental health, many employees continue to experience stress, anxiety, and burnout without adequate support. Cultural stigma, fear of professional consequences, and lack of structured organizational policies often prevent employees from seeking help. This project addresses these concerns by analyzing real-world data to understand how mental health is perceived and supported within the tech industry.

The scope of the project includes examining employer policies, employee comfort levels, and behavioral patterns related to mental health. While the study provides broad insights across regions, it is limited by the self-reported nature of survey data and variations in cultural perceptions. Nevertheless, the project contributes to ongoing conversations around workplace mental health by emphasizing innovation in organizational practices and data-driven decision-making.

Project Objectives

The primary objective of this project is to evaluate mental health awareness and support mechanisms within the technology industry using survey-based data analysis. The project aims to identify how employees perceive mental health issues and how organizations respond to these challenges.

Specific objectives include:

- To analyze the availability of employer-provided mental health benefits.
- To understand employee comfort levels in discussing mental health issues with coworkers and supervisors.
- To examine trends in professional help-seeking behavior among tech employees.
- To evaluate workplace attitudes toward mental health compared to physical health.
- To explore geographic differences in mental health awareness and support.

By achieving these objectives, the project seeks to uncover gaps between employee needs and organizational practices. The expected outcome is a clearer understanding of current mental health support structures and actionable insights that organizations can use to improve employee well-being and productivity.

Methodology

The project is based on the analysis of a survey dataset collected from employees working in the technology sector across various countries. The dataset includes both qualitative and demographic variables related to mental health perceptions, workplace policies, and personal experiences.

Tools used (e.g., *SQL, Power BI*)

Type of analysis (descriptive, comparative dashboards)

Key steps in the methodology include:

- Data understanding and exploration to identify relevant variables.
- Selection of Key Performance Indicators (KPIs) such as mental health benefits, help-seeking behavior, workplace attitudes, and geographic context.
- Descriptive analysis to identify trends and patterns across different groups.
- Comparative analysis across regions to observe cultural and organizational differences.

Results

The analysis revealed that organizations offering formal mental health benefits tend to foster more positive employee attitudes toward mental well-being. However, many employees still feel uncomfortable discussing mental health issues openly due to stigma or fear of judgment. Professional help-seeking behavior varies significantly across regions, influenced by cultural norms and access to healthcare. Overall, while awareness is increasing, consistent and effective mental health support remains uneven across the tech industry.

Learning and Reflection

This project provided valuable learning experiences in both technical and analytical domains. From a technical perspective, it enhanced skills in data interpretation, KPI identification, and analytical thinking. Understanding how qualitative survey data can be transformed into meaningful insights was a key learning outcome.

From a conceptual standpoint, the project deepened awareness of mental health challenges faced by professionals in the tech industry. It highlighted the complexity of mental health issues and the role organizational culture plays in shaping employee experiences. Reflecting on the results reinforced the importance of empathy, ethical data use, and responsible analysis when working with sensitive topics.

Overall, the project strengthened the ability to connect data analysis with real-world social issues, promoting a more holistic and human-centered approach to technology and analytics.

Social / Industry Relevance of the Project

This project holds strong social and industrial relevance, as mental health directly affects employee performance, job satisfaction, and organizational success. In the tech industry, untreated mental health issues can lead to burnout, reduced productivity, high attrition rates, and increased healthcare costs.

From a social perspective, the project highlights the need to normalize conversations around mental health and reduce stigma in professional environments. It emphasizes the importance of inclusive policies that consider cultural diversity and individual differences. From an industry standpoint, the findings encourage organizations to invest in mental health programs, employee assistance initiatives, and supportive leadership practices.

By providing data-driven insights, the project supports evidence-based decision-making for human resource departments, managers, and policymakers aiming to build healthier workplaces.

Conclusion and Future Scope

Future Scope

The project can be extended by incorporating larger and more diverse datasets, including longitudinal data to track changes over time. Advanced analytics and machine learning techniques can be applied to predict burnout risk or identify high-impact interventions. Additionally, qualitative interviews could complement survey data to gain deeper insights into employee experiences.

Conclusion

In conclusion, this project successfully explored mental health awareness and support within the tech industry. The findings reveal progress in awareness but also underline persistent gaps in organizational support and open communication. By emphasizing data-driven insights and human-centered approaches, the project contributes to the growing need for healthier, more supportive workplaces. Addressing mental health is not only a social responsibility but also a strategic necessity for sustainable industry growth.
